

GO WIRELESS

Allow your pushback, wing walking and de-icing teams to communicate far more efficiently.

Increase safety and decrease turnaround times

Our duplex wireless communications are supporting aircraft ground handling teams across the world to:

- Reduce aircraft collision/damage risk
- Improve ground handling team safety (no more tripping)
- Increase pushback-to-cockpit communication range
- Quicken pre-flight and pushback turnaround times

Here are just some of the ways our solutions can be used:

Standard Pushback

Single-person wireless communications allowing a pushback operative to talk directly to the cockpit.

Multiple pushback operatives communicating with each other and the cockpit.

Pushback + Wing Walking

One operative has a dedicated cockpit link and a secondary link to all wing walkers.

De-icing (two operatives and two vehicles)

Each de-icing pair (the person in the vehicle and the person in the bucket) can communicate wirelessly.

Multi-user De-icing pad solution

De-icing pad solution links all de-icers together and provides a single link between each de-icer and driver.

There are hundreds of possible scenarios. The biggest benefit of our wireless solutions is that we can easily adapt our products for your operations.
